

Achievement 3 - Task 3.1

Part 1:

Scenario One:

I would use Vue.js because of its adaptability. The scale requirements should be fine for a small-medium app.

Scenario Two:

I would use Angular for this app. It's ability to handle large scale projects, and the associated build tools would be most helpful for this project.

Scenario Three:

I would use React. It helps programmers build websites and apps faster, and is sufficient to make the UI look and work the way they want them to.

Part 2:

React is the most popular framework because it was designed to keep code efficient and well organized. It is the framework that will be most effective at building this movie app because of its high functionality with UI.
